## Acknowledgement

Compilation of this publication was taken under the supervision of Mr. Abdul Ramadhan Abeid (Director of Economic Statistics Department), Mr. Bakari Kh. Kondo (Manager of Real Statistics Section) and Mr Khamis A. Shauri (Head of Price Statistics Unit). Staff involved from Price Statistics Unit are, Ms. Salma S. Ally (Statistician), Mr. Khamis A. Msham (Statistician), Ms. Mwatima Kheri Chimbeni, Ms. Mwatima B. Abdi, Mr. Said Shaame, Ms. Rahma Said Hassan, and Mr. Hamad Khamis Rashid (statistical officers). OCGS highly appreciates the efforts they made to complete this piece of work.

The success on production of this publication was mainly due to the timely supply of the required input indicators provided by staff from other statistical units in the OCGS. The office would like to provide its gratitude to all who participated and provide vital contributions and the role they played which enabled to timely release of this publication.

Special thanks should go to the data suppliers from both private and public sectors for valuable inputs; acknowledgements also go to individuals who helped in data collection and processing. . It is through their efforts that we have been able to produce this valuable publication.

## Chapter One:

## Introduction

Zanzibar Consumer Price Index - Compilation Procedures and Indices is the third in the series of Consumer Price Index (CPI) publications. It replaces the previous publications and provides methodological information for compilation of Zanzibar Consumer Price Index. The first publication was published in August 1997 which contained statistical methodology used for compilation of CPI based on CPI weights produced from 1991/1992 Household Budget Survey (HBS). The second was published in July 2014 and the current publication has covered price collection procedures, validation of prices, imputation of missing price, construction of weights and instructions for field agents.

The CPI is an index number measuring the average price of consumer goods and services purchased by households for their final consumption expenditure. The percentage change in the CPI is a measure of inflation rate. (i.e., a measure of how fast the overall level of consumer prices is changing). The CPI can be used to index (i.e., adjust for the effects of inflation) wages, salaries, pensions and regulated or contracted prices.

Inflation can be defined as a persistent rise in the general price level. The opposite of inflation is deflation, a decrease in the general level of prices. Inflation rate is the rate of increase of the average price level (a measure of inflation). Alternatively, the inflation rate is the rate of decrease in the purchasing power of money.

OCGS collects and compiles prices of consumer goods, utilities and services and then produces the index (CPI) on monthly basis. Other related indices compiled in the process are:

* Annual Inflation: Changes in average prices compared with the preceding 12 months period; this is the average annual inflation considering price movement within the whole year.
* Month to Month Inflation: Month to month change in prices; this compares prices of the current month on previous month (or inflation)
* Year on Year Inflation: Change in price over 12 month, this is year on year inflation calculated as a percentage change in prices of current month compared with the same month, a year ago.

The Zanzibar Consumer Price Index (ZCPI) has been developed in accordance with international recommendations and standards. It refers to the consumption pattern of the average household of Zanzibar and it is intended to measure the average change between two time periods in the prices of the consumer goods and services acquired by households (the market basket). However, the households' use of their own produce, which is common in Zanzibar's population, is included in the weights of the ZCPI although these products are not purchased. The price changes for these products are derived from imputed market prices.

The ZCPI is an important index for estimation of inflation rate in Zanzibar as perceived by households and is a proxy indicator of cost of living. Furthermore, it provides macroeconomic indicator (as a deflator) for general economic and social analysis and policy determination especially monetary policy and for adjusting payments - such as wages, rents, interests and social security benefits. .

The revision of the ZCPI weights depends on availability of consumption-expenditure data. The weights of the revised ZCPI are based on the results of the 2014/2015 HBS and the reference period for price comparison is January 2017. The ZCPI is constructed according to the recommended international standards and classification based on the Classification of Individual Consumption by Purpose (COICOP-HBS)

Office of the Chief Government Statistician (OCGS) compiles the ZCPI with high professional standards and with regular quality assurance in order to ensure the accuracy and reliability of the index.

## Scope of Zanzibar Consumer Price Index

The ZCPI covers both Unguja and Pemba islands from which the Zanzibar totals expenditures are derived. The goods and services included in the ZCPI are classified according to COICOP-HBS. The COICOP-HBS provides internationally comparable product codes at six digits level, but allows an additional digit for the coding of local varieties. Food products, such as cassava and sweet potatoes, which are important in most African households, are classified as products under their group of root crops.

Selection of locations (outlets) for collecting prices is at places where volumes of products needed for pricing are available. These are town locations, centres of businesses (e.g. markets), densely populated areas and popular establishments along the line of goods and services to be priced.

Note: The basis of price collection is an outlet; practical pricing is undertaken in permanently selected outlets from which the households make their purchases. For example retail shops or stores, permanent or market stalls and at establishments that provide services (e.g. health and education services providers).

## Chapter Two:

## Source of Household Expenditure

The fieldwork for the 2014/2015 HBS started in October 2014 and ended in September 2015. A total of 4,555 individual households were interviewed. The same HBS provides the expenditure pattern of households as well as baseline measures for poverty monitoring and evaluation.

The household expenditures were recorded using HBS Form II (i.e. Dwelling, Utilities, Water and Sanitation and Household Expenditure) for the reference expenditure of more than three (3) or equal to months. The survey also recorded daily expenditure using the HBS Household Diary

## Weight Structure

The households' expenditure survey results provide the information needed to generate the weights used in the computation of the ZCPI. The weights reflect the total expenditure for all households on various categories of goods and services. Weighting of each product in the basket is a way of expressing the importance of the product. Table 2.1 below shows the weight structure of the new index.

Table 2.1: Structure of 2014/15 HBS Weights

|  |  |
| :--- | ---: |
| COICOP | Weights |
| Food and Non-Alcoholic Beverages | 43.6 |
| Alcohol Beverages, Tobacco and Narcotics | 0.2 |
| Clothing and Footwear | 6.9 |
| Housing, Water, Electricity, Gas, and Other Fuels | 18.4 |
| Furnishing, Household Equipment and Routine Household Maintenance | 5.5 |
| Health | 2.1 |
| Transport | 9.6 |
| Communication | 4.2 |
| Recreation and Culture | 1.3 |
| Education | 1.9 |
| Restaurants and Hotels | 3.9 |
| Miscellaneous Goods and Services | 2.3 |
| All Items | $\mathbf{1 0 0 . 0}$ |

## Selection of Products

The products included in the basket of goods and services were selected by their relative importance in the consumption of household, this was taken by proportion (plutocratic) of at least $0.02 \%$. However, few items were taken by a proportion of $0.01 \%$ to represent their respective sub group in the COICOP-HBS. The total number of goods and services in the basket are 343 whereby food products are 112 and non-food products are 231 . To each product, an expenditure weight was assigned (Appendix I)
In addition, two criteria were also taken into account in selecting items:
a) Continuous availability of the product in the market
b) Easy recognition for future pricing.

## Selection of Centres and Outlets

A total of 10 centres were allocated in urban areas (in both Unguja and Pemba) and are visited monthly. The allocated Centres in Unguja are Darajani, Mkunazini, Malindi, Mlandege, Mchangani, Mikunguni and Mwanakwerekwe and in Pemba are Chake Chake, and Wete. The outlets were selected based on the assumption and experiences
including volume of products, popularity of the outlet, and expectation of continuous availability of products. The outlet types available in the urban areas of Zanzibar are shops and stalls, which are available in open and super markets. Final selection of an outlet was based on the results of the interview conducted with the shopkeepers. Shopkeepers who were cooperative and confirmed that their outlets will not be closed down in the near future were selected. It is important that a field data collector establishes a friendly relationship with a shopkeeper. However, if a shopkeeper becomes uncooperative over time, a field data collector consults the supervisor for the possibility of replacing the outlet. The prices are being collected from 641 outlets whereby 234 are in Pemba and 407 are in Unguja.

## Base Period

The base year of the index reference period for the comparison of prices of the ZCPI is January 2017, which sets the index number to 100 . It is the reference point of the index number series. The January 2017 was considered as base year with an assumption that the year was perceived to be politically, economically and socially stable

## Chapter Three:

## Price Collection Methodology

## Data Collection

Data collection is carried out on the second and third weeks (from $10^{\text {th }}$ to $20^{\text {th }}$ ) of each month (Table 3.1), which is eleven days of price data collection as reference days for the month. The selected outlets are visited and at least three price quotations of well-defined product specifications are collected for every product listed for price collection. Trained OCGS staffs are recruited as price collectors. Price collection is done under the close supervision of the OCGS senior staff.

## Table 3.1: Timetable for Data Collection

| Date | Unguja Center | Date | Pemba Center |
| :--- | :--- | ---: | :--- |
| 10 | Darajani Market | 10 | Chake Chake Market |
| 10 | Mikunguni Market | 10 | Wete Market |
| 10 | Mwanakwerekwe Market | 10 | Machomane Market |
| 11 | Malindi Center | 11 | Chake Chake Centre |
| 14 | Darajani Center | 13 | Machomane Centre |
| 15 | Mchangani Center | 15 | Wete Centre |
| 16 | Mkunazini Center | 16 | Chake Chake Centre |
| 17 | Mlandege Center | 17 | Machomane Centre |
| 18 | Mikunguni Center | 18 | Wete Centre |
| 19 | Mwanakwerekwe Center | 19 | Call Backs Wete Centre |
| 20 | Call Backs | 20 | Call Backs Chake/Machomane Centre |

## Price Collection Procedures

Price collectors are provided with questionnaires containing instruction of the product (Appendix II). In practice, the prices of various types of food and non-food products are obtained from one outlet in each of the three urban markets selected; however, there are few food and non-food products that are collected in other outlets. Prices on house rent are collected on Government Institutions (Wakf House, Kikwajuni, Mombasa and Michenzani apartments each with two rooms). Prices of public utilities (electricity and water) are collected from Zanzibar Electricity cooperation (ZECO) and Zanzibar Water Authority (ZAWA).

For products not sold in standard weights such as starchy root crops, vegetable, fruits, fresh chicken and fish, price collection is done through actual purchase from selected outlets. The purchased products are weighed to derive price of 0.5 kg for some products and 1 kg for other products.

For items available in retail outlets which are sold in the form of standard weights, price collectors quote prices of product of specified specifications., If product specifications change, replacement of a similar product is made, taking into account observed changes in specifications, For services such as house rent, transport, domestic servant, fuel and electricity price collection is carried out by quoting from both the public enterprises and private companies.

## Treatment of Closed Outlet

(a) If by asking neighbouring price collectors finds out that the outlet is closed for a few days, the price collectors returns to the outlet few days later within the same month to obtain the prices.
(b) If the outlet is closed for a month or more, price collectors will return to visit it when it opens again. The missing price data for the current month will be automatically imputed following the change in prices for the same variety in other outlets. However, if the outlet remains closed for three months or more, price collectors will replace it following the instructions given in (c) below.
(c) If the outlet continues to be closed, the field price collectors should try to locate a similar outlet (same type, size, location, product mix and prices) and propose to introduce it as a replacement. With the approval of the supervisor and following a thorough investigation of item by item matching substitute (see below), a new comparable outlet can be introduced.

## Treatment of Missing Item

(a) If the item/variety is temporarily missing (up to maximum of three months for nonseasonal items and up to eight months for seasonal items), the space for the price will be left blank. The price collector is strictly prohibited to quote any estimate for the missing price. The missing price will be automatically imputed in the calculations at the office on the basis of changes in the prices of available items of the same product group. The imputed price will not appear in the price collection form for the coming month as data for the previous month. This will allow for self-correction when the item reappears.
(b) If the item/variety has been discontinued (or has not reappeared after three months), a substitute needs to be found with the help of the shopkeeper. It should be as similar as possible to the previously used item with respect to brand, origin, quality and price. The proposed item and price should be discussed and approved with the supervisor. The new item will be introduced in CPI calculations.

## Treatment of Item Change

(a) If there is a change in the quality or content of the variety priced, price collectors needs to determine whether the difference in characteristics do or do not affect the price. In the latter case nothing needs to be done except for a minor change in specifications. But if the change has affected the price, obviously a new variety has appeared and the field agent should try to obtain the price of this variety for the current and the previous period. These prices will then be entered in the file and they will be used to calculate the price change for the current month. This solution is not ideal as it assumes that the difference in price between the new and the old variety is fully explained by the difference in quality. But it is easier to apply than to try to separate the quality difference from the price change for these two varieties.
(b) In general, prices for varieties of different brand, quality, and country of origin should not be directly compared for pricing.

## Data Entry Process and Data Submission

The data entry process is carried out accordingly, once the price data collection and supervisor's manual checks have been done. The data are entered into the CPI computation system; field enumerators are responsible to enter data in the computer.

Before submitting the monthly price data to headquarters, the branch office staff in Pemba is instructed to carefully check and correct the data collected in the outlet form. The data are entered on a spreadsheet where items/varieties have their appropriate outlet and COICOP codes. The spreadsheet is submitted to headquarters through e-mail and directly imported into the CPI computation files. The deadline for submitting all the price data is $26^{\text {th }}$ day of each month. The data entry is completed in three days after $20^{\text {th }}$ day of price data collection.

## Chapter Four:

## Computation of Consumer Price Index and Inflation Rate

## System used for Index Calculation

There is a special module developed in the Microsoft Excel Visual Basic Application (VBA) used to compute all indices. The compiler uses Microsoft Excel as working interface. The methodology of compilation of index is based on Modified Laspeyre's Weighted Index methodology and uses stepwise aggregation from Elementary Aggregate to High Level Indices. The compiler has modules on price importation for specified region, weight importation, imputation of missing prices and index computation.

There are several spread sheets that are used as shown below

## Index Points and Percentage Change

Movement in index for one period to another can be expressed as a percentage change or changes in index points. The difference between the two approaches to describe movements in indices is shown by the following example:
i). Change in Index Points

All item CPI for December $2015=115.4$
All item CPI for December $2016=123.5$
Change in index points is given by:

Change in index points = All item CPI for December 2016-All item CPI for December 2015

Therefore:

$$
\text { Change in index points }=123.5-115.4=7.7
$$

## ii). The Percentage Change

The percentage change in an index between any two periods calculated by subtracting the index value for the earlier period from the later period, and dividing the result by the value for the earlier period then multiplied by 100 .

Therefore, percentage change from December 2016 to December 2015 is given by:

$$
\text { Percentage Change }=\frac{123.5-115.4}{115.4} x 100=6.7 \%
$$

Analysis: The CPI in December 2016 increased to 123.5 from 115.4 in December 2015 showing an increase of 7.7 index points or 6.7 percent.

## Computation of Inflation

Inflation rate is measured by comparing the CPI of the current month with that of the same month a year ago.

$$
\text { Inflation Rate }=\frac{C P I_{2}-C P I_{1}}{C P I_{1}} \times 100
$$

Where by
$\mathrm{CPI}_{2}$ - is the CPI in the current period and $\mathrm{CPI}_{1}$ - is the CPI in the same period 12 months ago
